Fusionwall Cleaning

Maintaining your acrylic and keeping it clean is a simple process. Another benefit of this plastic material is how hygienic it is. Acrylic can be wiped clean and disinfected with the majority of regular home cleaners, which is why it is commonly used for decor items such as showerwalls and kitchen backsplash.

Here is our quick guide to keeping your acrylic materials clean:

- **Use warm, soapy water and a sponge or microfiber cloth:** You do not need to use any additional chemicals to clean acrylic. Make sure to clean with soft materials and not apply too much pressure to avoid scratching the material. Denatured alcohol can be used for stubborn areas.
- **To polish your acrylic, use plastic polish such as Gel Gloss or any automotive wax** For the best finish, we recommend using polish that has been specifically designed for acrylic or plastic.
- **Leave to air dry or use a clean cloth:** Do not wipe your acrylic with paper towels or materials with a rough surface. Leaving acrylic to air-dry is absolutely fine.
- **Avoid using anything containing ammonia:** Ammonia is a no-go chemical around acrylic as it can cause the plastic to turn cloudy, ruining the appearance of your plastic. You should also avoid items such as window and glass cleaners.
- **Replacing the caulking:** the caulking is the only maintenance item that will need to be replaced from time to time. Use a utility knife to cut out the caulk being careful not to scratch or cut the acrylic. Then re-apply.
